```
Step 1 – Brock Allens Spare Linux Laptop (or login on Duane's Laptop)
```

Step 2: log in as brock, local password: pass123

Step 3: cd MAC/lprf-timac-2-apps

Step 4: git pull

Step 5: if desired:

cd linux

bash ./build_all.sh host bash ./build_all.sh bbb

Step 6: cd installer

Step 7: EDIT file: common.sh → Change Version Number EDIT file: keyword_variables.ini → Change Version Number (this really should be done in one file, but sadly it still two files)

Step 8: Create JIRA ticket for Version number change.
Git commit version number change referencing above ticket.
GIT push

Step 9: Run the build script:

bash ./00_main.sh

Step 10 – about 10 minutes – look in the \${root}/linux/release folder

The installer is the RUN file

Step 11 - The 00_main.sh script creates a log file, "copy_file_log.txt
Rename this log file to: release_<DATE>_log.txt
'git add <FILENAME>.txt'
'git commit -m'ABOVE_JIRA_TICKET' release_<DATE>_log.txt
'git push'

Step 12 – Copy the "run" file to where ever it needs to go
